

DC web public site gateway API

General protocol specification and definitions

The request protocol specification

The HTTP request GET and POST method used. Possible URL parameters are: "json" and "cmd".
The GET method requires url-encoded value.

The general HTTP request format with the GET method:

<server_url>/TagsReaperUI/api?json=<batch_url_encoded_buffer>

or

<server_url>/TagsReaperUI/api?json=<batch_url_encoded_buffer>&cmd=0

The general HTTP request format with the POST method:

<server_url>/TagsReaperUI/api?json=cmd=0

where the POST buffer is BATCH command json, or:

<server_url>/TagsReaperUI/api?json=cmd=1

where the POST buffer is URL_CONTENT command json.

The gateway provides the json buffer as is for the DCC input. The response is general DCC's response format. For more information see the DC_application_architecture.docx specification the DCC application section.
